

Deliverable 4: Wireframes & Feature Plan

CSC425 Fall 2025

Student Name: Rizwan Syed

Date Submitted: 09/19/25

Branch Name: d4-RizwanSyed

1. Low-Fidelity Wireframes (Mobile-First)

<https://www.figma.com/design/Simat6D3xeJZynIGwGFGDI/ShadowMeWireframe?node-id=0-1&t=0mxcMHtamj3ijDzj-1>

Please see the Figma design at the above link.

2. Functional Requirements

- User authentication (sign up, login, logout)

Sign up, log in, log out.

- CRUD operations for [specific data in your app]

Add account (validate date), Login (access and validate request), Create/delete/edit Appointment, Create request to join appointment, Change profile data for user, chatroom history.

- Navigation between core pages (Login → Dashboard → Features)

Shown in Figma, please let me know if you are unable to access.

- Data persistence with backend integration

Will be able to perform validation on all data that comes into and goes out of the database. Should appear correct to the user so long as it is parsed and added to the GUI correctly.

- Error handling & input validation

Username and password need to be valid (possibly a moderately strict password complexity policy), appointments must have valid times/dates.

3. User Stories

1. As a student, I want to access valid appointment options so that I can avoid spending time and money to no avail.

2. As a medical practitioner, I want to filter out malicious actors/requests so that I can keep only prospective medical students in communications with my clinic, thus keeping my practice secure.
3. As a student, I want the option to express my profile so that I can find opportunities that are valid to my field of study.

4. User Journey Flow

1. User will open app and see login screen
2. User creates account and uses it to login.
 - a. Must be valid account creation to send the user back to login and send 200 HTTP response.
3. User is prompted that he should update his profile before he tries to communicate with any medical practitioners.
 - a. He may view appointments but will not be able to request one until he has a valid profile.
 - b. This is to ensure that M.D.s do not get spam requests.
 - c. Once a request is accepted, it will automatically open up a chatroom.
4. User makes a request, opens chatroom with M.D., is prompted to reply in a very polite and cordial manner, sending any necessary details to the M.D. and confirms that he will be in attendance. The M.D. may provide any details for arriving at the proper location.
 - a. M.D. accounts will have an auto-reply field in their profile, which will send a string of characters to all students whose requests have been accepted by that M.D.
5. If the user is an M.D. account, he will make available appointments in this step.
 - a. We would like for repeat sessions to be made available, so the form to create appointments should include support for repeated appointments.
6. User signs out, session ends.
